

MEASURING HINGE OFFSETS

Knowledge Base: 1704

Edgemount Hinges

Edgemount hinges may have their offset determined by one of two different methods depending on manufacturer (see examples at right). Distance shown between arrows is equal to offset of hinge.

What's An Offset?

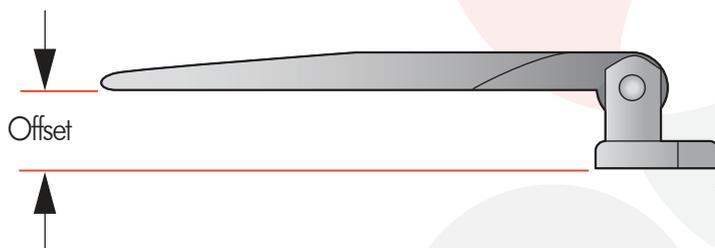

Offset, as measured on refrigerator doors, is simply the difference in millimeters between the outside surface of the door and the outside surface of the frame or cabinet to which the door seals.

Measuring The Door Offset

Measure distance from the surrounding cabinet surface to the door face. The measurement will be the "offset" of the door.

Facemount Hinges

Measure from base of hinge to level position of strap.
